1 Introduction

In 2019, the Bureau of Safety and Environmental Enforcement (BSEE) sponsored a project in cooperation with the United States Coast Guard (USCG) to improve the content of the coastal zone area contingency plans (ACPs) with respect to the information necessary to effectively plan for and respond to large oil spills from offshore oil and gas facilities. This collaboration between BSEE, USCG District Eight, resource trustees, state agencies, oil spill response organizations (OSROs), and Area Committees resulted in a series of technical documents that provide offshore information for the Gulf of Mexico (GOM) on:

- Oil and Gas Infrastructure (GOM Technical Document #1)
- Worst Case Discharge Scenarios (GOM Technical Document #2 and Appendices 2A-F)
- Response Concept of Operations (GOM Technical Document #3)
- Response Strategies and BMPs (GOM Technical Document #4)
- Sensitive Species Profiles (GOM Technical Document #5).

These documents were developed specifically for incorporation by reference into the coastal zone ACPs and are hosted on the BSEE Oil Spill Preparedness Division’s (OSPD) website.

The WCD scenario information in Technical Document #2 is organized into three main components: Section 2 contains a description of key modeling concepts and reference scales that are useful for understanding the oil spill trajectory data and figures that have been developed for each of the WCD scenarios. Section 3 contains a series of tables that collate and summarize key information regarding all of the WCD scenarios that were developed for the GOM. Appendices 2A – 2F contain specific, more detailed WCD scenario modeling data and trajectory figures for each of the ACP Planning Areas in the GOM. Appendix 2A contains the modelling information for two offshore WCD Scenarios located in the South Texas Coast Zone ACP.

2 Panther Operating Pipeline Discharge

2.1 Scenario Description

The Panther Operating Pipeline Discharge WCD Scenario is a pipeline discharge with the following key parameters:

Table 1. Scenario Key Parameters.

<table>
<thead>
<tr>
<th>Discharge Depth (m)</th>
<th>Distance from Shore (NM)</th>
<th>Oil Type</th>
<th>Spill Type</th>
<th>Discharge Duration from Well (days)</th>
<th>Discharge Flowrate from Well (bbl/day)</th>
<th>Total Oil Discharged (bbl)</th>
</tr>
</thead>
<tbody>
<tr>
<td>63</td>

2.2 Potential Oil Contact with the Environment and Resources at Risk

Figure 1. Probability Footprint for Oil on the Water Surface with Average Thickness greater than the Ecological Threshold of 10 µm.
Figure 2. Minimum Travel Time for Oil on the Water Surface with Average Thickness greater than the Ecological Threshold of 10 µm.

Table 2. Oil Spill Stochastic Results – Predicted Shoreline Impacts.

<table>
<thead>
<tr>
<th>Percentage of Simulations Reaching shore (%)</th>
<th>Percent volume of discharged oil reaching shore (%)</th>
<th>Time to Reach Shore (days)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Maximum</td>
<td>Average</td>
</tr>
<tr>
<td>97.2</td>
<td>40</td>
<td>16</td>
</tr>
</tbody>
</table>
Figure 3. Probability Footprint for Oil on the Shoreline with Average Thickness greater than the Ecological Threshold of 10 µm. This thickness of oil may appear on the shore as dark stain or film. 10 µm is a conservative ecological screening threshold for potential sublethal effects on fauna and birds on the shoreline.
Figure 4. Probability Footprint for Total Hydrocarbon Concentration (THC) concentrations in the Water Column greater than the Ecological Threshold of 10 µg/L (~10 ppb). 10 ppb (µg/L) of whole oil (THC) corresponds to ~0.1 µg/L (~1 ppb) of dissolved Polycyclic Aromatic Hydrocarbons (PAHs) for fresh crude oils. This threshold can result in sublethal impacts to early life stages of fish and invertebrates in the upper ~20 meters of the water column if exposed to UV light.
The “worst case” deterministic simulation is a single oil trajectory run using the time period and ambient conditions that resulted in the greatest area of shoreline oiling. The simulation resulted in oiling in the following cumulative amounts:

- Oiled Surface Area Exceeding 0.04 µm (Socioeconomic Impact) = 6,776 mi²
- Oiled Surface Area Exceeding 10 µm (Ecological Impact) = 10 mi²
- Oiled Shoreline Exceeding 10 µm (Ecological Impact) = 222 mi
- Water Column Oil Exposure Exceeding 10 ppb Dissolved PAH (Ecological Impact) = 96 million m³
- Time to Shore = 29.3 Days

These impact values are calculated considering no response measures are taken to secure the source of the spill or to contain, remove, or disperse oil at the scene.

Table 3. Mass balance at the end of the worst case deterministic simulation (% of the total volume of oil discharged*).

<table>
<thead>
<tr>
<th>Total Oil Discharged</th>
<th>Surface</th>
<th>Evaporated</th>
<th>Water Column</th>
<th>Sediment</th>
<th>Ashore</th>
<th>Degraded</th>
</tr>
</thead>
<tbody>
<tr>
<td>3,052 bbl</td>
<td>1.5%</td>
<td>43.9%</td>
<td>10.7%</td>
<td>0.1%</td>
<td>17.3%</td>
<td>26.5%</td>
</tr>
</tbody>
</table>

*Important to note these values are not indicative of the maximum amount of oil in each compartment, but instead show the final amount of oil in each compartment.

Figure 5. Mass Balance over Time for worst case deterministic simulation.
Figure 6. Cumulative Maximum Concentration of Dissolved Polycyclic Aromatic Hydrocarbons (PAH) within the water column at any time during the worst case deterministic simulation period. Dissolved PAH concentrations greater than ~10 µg/L (~10 ppb) could affect plankton in the upper ~20 m and impart sublethal to lethal effects on other water column biota (adult, juvenile fish, and invertebrates).
2.3 Response Planning Information

Figure 7. Cumulative Maximum Concentration of Floating Oil and Total Hydrocarbons on the Shoreline at any time during the worst case deterministic simulation.
Figure 8 Cumulative footprint of exposure to surface floating oil greater than the minimum oil viscosity over a 45-day period for the worst case deterministic simulation. Viscosities greater than those mapped may be present at any location at any specific time in the simulation. This graphic provides a perspective of how oil viscosity may change as oil is transported away from the discharge site over time, and what areas may be amenable to dispersant operations where enough quantities of oil are present.
3 Anadarko Drilling King North Well H Blowout

3.1 Scenario Description

The Anadarko Drilling King North Well H Blowout WCD Scenario is a subsea well blowout with the following key parameters:

Table 4. Scenario Key Parameters.

<table>
<thead>
<tr>
<th>Discharge Depth (m)</th>
<th>Distance from Shore (NM)</th>
<th>Oil Type</th>
<th>Spill Type</th>
<th>Discharge Duration (days)</th>
<th>Discharge Flowrate (bbl/day)</th>

BSEE-USCG Offshore Information for Area Contingency Planning
Offshore WCD Scenario Modeling - AL, MS, & NWFL ACP, Technical Document 2, Appendix 2F
Figure 11. Probability Footprint for Oil on the Shoreline with Average Thickness greater than the Ecological Threshold of 10 µm. This thickness of oil may appear on the shore as dark stain or film. 10 µm is a conservative ecological screening threshold for potential sublethal effects on fauna and birds on the shoreline.
Figure 12. Probability Footprint for Total Hydrocarbon Concentration (THC) concentrations in the Water Column greater than the Ecological Threshold of 10 µg/L (~10 ppb). 10 ppb (µg/L) of whole oil (THC) corresponds to ~0.1 µg/L (~1 ppb) of dissolved Polycyclic Aromatic Hydrocarbons (PAHs) for fresh crude oils. This threshold can result in sublethal impacts to early life stages of fish and invertebrates in the upper ~20 meters of the water column if exposed to UV light.
The “worst case” deterministic simulation models is a single oil trajectory run using the time period and ambient conditions that resulted in the greatest area of shoreline oiling. The simulation resulted in oiling in the following cumulative amounts:

- Oiled Surface Area Exceeding 0.04 µm (Socioeconomic Impact) = 330,117 mi²
- Oiled Surface Area Exceeding 10 µm (Ecological Impact) = 41,575 mi²
- Oiled Shoreline Exceeding 10 µm (Ecological Impact) = 2,052 mi
- Water Column Oil Exposure Exceeding 10 ppb Dissolved PAH (Ecological Impact) = 258,175 million m³
- Time to Shore = 13.4 days

These impact values are calculated considering no response measures are taken to secure the source of the spill or to contain, remove, or disperse oil at the scene.

Table 6. Mass balance at the end of the worst case deterministic simulation (% of the total volume of oil discharged*).
