

The NewsRoom**Release:** #4051**Date:** November 12, 2009**Tropical Storm Ida Activity Statistics Update – November 12, 2009***Minerals Management Service Concludes Its Continuity of Operations Plan Activities*

NEW ORLEANS — The Minerals Management Service (MMS) Continuity of Operations Plan team is concluding its activities related to Tropical Storm Ida. This is the final update of evacuation and shut-in production statistics for Tropical Storm Ida.

Based on data from offshore operator reports submitted as of 11:30 a.m. CST today, personnel have been evacuated from a total of 1 production platforms, equivalent to 0.1 % of the 694 manned platforms in the Gulf of Mexico. Production platforms are the structures located offshore from which oil and natural gas are produced. These structures remain in the same location throughout a project's duration unlike drilling rigs which typically move from location to location.

Personnel from 0 rigs have also been evacuated; this is equivalent to 0.0 % of the 66 rigs currently operating in the Gulf. Rigs can include several types of self-contained offshore drilling facilities including jackups, submersibles and semisubmersibles.

From the operators' reports, it is estimated that approximately 2.22 % of the oil production in the Gulf is shut-in. It is also estimated that approximately 2.66 % of the natural gas production in the Gulf is shut-in. Estimated energy production from the Gulf of Mexico as of March 2009 is 1.3 million barrels of oil per day and 7.0 billion cubic feet of gas per day.

As part of the evacuation process, personnel activate the shut-in procedure, which can also be accomplished from a remote location. This involves closing the safety valves located below the surface of the ocean to prevent the release of oil or gas. During the recent hurricane seasons, the shut-in valves functioned 100 percent of the time, efficiently closing in production from wells on the Outer Continental Shelf and protecting the marine and coastal environments. Shutting-in oil and gas production is a standard procedure conducted by industry for safety and environmental reasons.

The production percentages are calculated using information submitted by offshore operators in daily reports. Shut-in production information included in these reports is based on what the operator expected to produce that day. The shut-in production figures therefore are estimates, which the MMS compares to historical production reports to ensure the estimates follow a logical pattern.

After the hurricane has passed, facilities will be inspected. Once all standard checks have been completed, production from undamaged facilities will be brought back on line immediately. Facilities sustaining damage may take longer to bring back on line. MMS will no longer report Tropical Storm Ida statistics.

	Total	Percentage of GOM Manned Facilities
Platforms Evacuated	1	0.1 %
Rigs Evacuated	0	0.00 %
	Total Shut-in	Percentage of GOM Production
Oil, BOPD Shut-in	28,889	2.22 %
Gas, BCFD Shut-in	0.186	2.66 %

This survey information is reflective of 18 companies' reports as of 11:30 a.m. CDT.
