Tropical Storm Bonnie Activity Statistics Final Update– July 27, 2010

*The Bureau of Ocean Energy Management, Regulation, and Enforcement
Monitors Activities through its Hurricane Response Team*

NEW ORLEANS, LA — The Bureau of Ocean Energy Management, Regulation, and Enforcement’s (BOEMRE) Hurricane Response Team is concluding its activities related to Tropical Storm Bonnie. This is the final update of evacuation and shut-in production statistics for Tropical Storm Bonnie.

Based on data from offshore operator reports submitted as of 11:30 a.m. CST today, no production platforms remain evacuated; there are a total of 634 manned platforms in the Gulf of Mexico. Production platforms are the structures located offshore from which oil and natural gas are produced. These structures remain in the same location throughout a project’s duration unlike drilling rigs which typically move from location to location.

No rigs remain evacuated; there are a total of 39 rigs currently operating in the Gulf. Rigs can include several types of self-contained offshore drilling facilities including jackups, submersibles and semisubmersibles.

Vessels and drilling rigs involved in the BP oil spill response were required to curtail or halt operations due to Tropical Storm Bonnie. For the latest information regarding the impacts of severe weather on the BP oil spill response, visit: <http://www.deepwaterhorizonresponse.com>.

As part of the evacuation process, personnel activate the shut-in procedure, which can also be accomplished from a remote location. This involves closing the safety valves located below the surface of the ocean to prevent the release of oil or gas. During the recent hurricane seasons, the shut-in valves functioned 100 percent of the time, efficiently closing in production from wells on the Outer Continental Shelf and protecting the marine and coastal environments. Shutting-in oil and gas production is a standard procedure conducted by industry for safety and environmental reasons.

From the operators’ reports, it is estimated that approximately 15.17 % of the oil production in the Gulf has been shut-in. It is anticipated that the shut-in oil production will be online by Wednesday, July 28, 2010. It is also estimated that approximately 6.52 % of the natural gas production in the Gulf has been shut-in. Estimated energy production from the Gulf of Mexico as of March 2010 is 1.6 million barrels of oil per day and 6.4 billion cubic feet of gas per day. . The remaining shut-in production is not associated with any reported damage.

The production percentages are calculated using information submitted by offshore operators in daily reports. Shut-in production information included in these reports is based on what the operator expected to produce that day. The shut-in production figures therefore are estimates, which the BOEMRE compares to historical production reports to ensure the estimates follow a logical pattern.

After the tropical storm has passed, facilities will be inspected. Once all standard checks have been completed, production from undamaged facilities will be brought back on line immediately. Facilities sustaining damage may take longer to bring back on line. The BOEMRE will no longer report Tropical Storm Bonnie statistics.

	Total	Percentage of GOM
Platforms Evacuated	0	0.00%
	0	0.00%
	Total shut-in	Percentage of GOM Production
Oil, BOPD Shut-in	242,758	15.17 %
Gas, MMCF/D Shut-in	417.0	6.52 %

This survey information is reflective of 5 companies' reports as of 11:30 a.m. CDT.
